FKIP Universitas HKBP Nommensen Pematangsiantar

Abstrak: penelitian ini bertujuan untuk menguji efek Think-Pare-Share strategi pada mahasiswa bahasa Inggris di FKIP Universitas HKBP Nommensen Pematangsiantar. Subjek penelitian terdiri dari 30 orang mahasiswa pada kelas experiment dan begitu juga pada kelas kontrol. Penelitian ini menganalisis data dengan mengaplikasikan metode quantitative karena data analisis berhubungan dengan angka yang dalam hal ini disebut dengan skormahasiswa. Penelitian ini dilakukan pada mahasiswa semester tiga tahun akademik 2014-2015 sebagai populasi dan sebagai sample adalah kelas A and B. Berdasarkan hasil analisis data, peneliti menguraikan temuan bahwa TPS memiliki efek terhadap pemahaman bacaan oleh mahasiswa. Temuan penelitian menunjukkan bahwa rata-rata skor di kelas experiment lebih tinggi dibanding rata-rata skor di kelas kontrol. Skor rata-rata di kelas eksperimen adalah 41,73 sementara di kelas control adalah 11,34. Terdapat 28 mahasiswa yang memperoleh rata-rata skortertinggi di kelas eksperimen yaitu 55,65 or 93% sementara rata-rata skortertinggi di kelas control adalah diperoleh 25 mahasiswa yaitu 41,34 atau 83%.

Kata kunci: efek, *Think-Pare-Share*, strategi, pemahaman bacaan.

Abstract: this research intends to investigate the effect of Think-Pare-Share (TPS) strategy in reading comprehension by the third semester of English Department Students at FKIP Universitas HKBP Nommensen Pematangsiantar. The subjects of the research are 30 students as experiment and control group. This research applies quantitative research method in analyzing the data which refers to the number in the form of students' value as the measurement of students' reading comprehension. This research conducted into the third semester at academic year 2014-2015 as the population and the sample is class A and B. based on the data analysis, the researcher finds out the effect of TPS strategy in students' reading comprehension by these research findings show that the mean of students' score in experiment class is 41,73 than in control class is 11,34. There are 28 students who get the highest score in experiment class. They get the mean score more than 55,65 or 93% students get high score while in control class there are 25 students who get the 41,34 mean score or 83% as the highest score.

Keywords: effect, *Think-Pare-Share*, strategy, reading comprehension,

INTRODUCTION

Reading is one of the human being activities that easy to do. It is meant that reading can be done any time in everywhere. The easy to be

done is not meant as easy to be understood. Some time catching the meaning of the text is not easy. When somebody read the text, it is

not only to pronounce the words involved in the text itself. Meanwhile reading is thinking and understanding and getting at the meaning behind a text (Seravallo 2010:43). Based on Kamil (2003:6) reading understands written texts. Additionally, McNamara (2006:4) inserts that reading is an extraordinary achievement when one considers the number of levels and components that must be mastered. Reading is a complex behavior which involves conscious and unconscious use of the meaning, which the writer is assumed to have intended.

Understanding the text is achieved by the purpose of obtaining information of some topics, obtaining instructions on how to perform some task for our work or daily life, acting in a play, keeping in touch with friends by correspondence, knowing where and when something will take place or what is available, knowing what is happening or has happened (Nunan, 2003:251). Doing these purposes in reading the text it means by comprehending of the text. In another terms it is called as reading comprehension. Reading comprehension is the ability to take information from written text and do something with in a way that demonstrates knowledge or understanding of that information. Comprehension occurs when a reader is able to act on, respond to, or transform the information that is presented in written text in ways that demonstrate understanding. It illustrates how readers can show they understand what they read. According to Kamil (2003:6) Comprehension is the process of making sense of words, sentences and connected text.

In comprehending the English text as the second language (ESL) there are always possibilities for the learners get difficulties since it would be a long and complex undertaking. To solve the problem, Think-Pair-Share is a part of Co-operative Learning Teaching strategy which is one of possible that can be applied by the learners. Co-operative learning was designed and implemented to develop social strategies and acceptable social attitudes in students, and to improve social relations within and between groups. Cooperative learning refers to a

variety of teaching methods in which students work in small groups to help each other in learning the subject matter. cooperative in class, students are expected to help each other, discuss and give argument with each other, to hone the skills that they possess at the time and close the gaps in their understanding (Brown 2003:50).

Think-Pair-Share is a cooperative learning technique that encourages individual participation and is applicable across all grade levels and class sizes. When teachers deliver lessons to the classroom, the students sit in pairs with each team. The teacher asks the class and students are asked to think of an answer of their own, then pair up with a partner to reach an agreement on an answer. Finally, the teacher asks the students to share their answers that they agree with the whole class (Slavin, 2005).

Think-Pair-Share is technique with great and its result in increased students participation and improved retention of information. Istarani(2011:67) says that Think-Pair-Share is a three-step structure in which students "**think**" individually about the question posed by the teacher (step1), "**pair**" up with a neighboring student and discuss their ideas together (step2), and "**share**" the ideas discussed in pairs with the entire class (step3). The ideas are to get you all to think the concepts that think the speakers' think. Think-Pair-Share could be prepared to recent topic.

Furthermore, Slavin(2005:56) explain that this activity preferably one demanding analysis evaluation or synthesis and gives students thirty seconds or more to think through appropriate response (**think**). This time can also be spent writing the responses. After this "wait team", students then return to partners and share their immediate feedback on their ideas (**pair**). During the third and last stage, students responses can be shared within learning teams, with larger groups or with the entire class during a follow-up discussion (**share**). The job of the group should be clearly expressed (Slavin: 1995).

The excess of the learning model and Think Pair Share are (1) Can increase the reasoning power of students, the students'

The list of value of pre-test and post test of experimental class in the table above showed that the lowest score of the pre-test is 20 and the highest is 68, while the lowest score in post-test is 48 and the highest is 100. After listing the name and the score, the researcher calculated the sum of all pre-test and post-test scores'. The result showed that the sum of the pre-test (Σ X) is 1252 while the sum of post-test (Σ Y) is 2284. Then the result showed that the sum of X² (Σ X²) is 57872 and sum of Y² (Σ Y²) is 179120. While, the sum of multiplication of X and Y (Σ XY) is 98880. The data showed that ability of the students in post-test is more increase than in pre-test.

30		900	1480	30736	77408	46160
				6	8	

The list of the value of pre-test and post test of experimental class in the table above shows that the lowest score of the pre-test is 16 and the highest is 52, while the lowest score in post-test is 24 and the highest is 68. After listing the name and the score, the researcher calculated the sum of all pre-test and post-test scores'. The result showed that the sum of the pre-test ($\sum X$) is 900 while the sum of post-test. Then the result showed that the sum of X^2 ($\sum X^2$) is 30736 and sum of Y^2 ($\sum Y^2$) is 77408. While, the sum of multiplication of X and Y ($\sum XY$) is 46160. The data showed that ability of the students in post-test in more increase than in pre-test.

The Level of the Student's Ability

In order to find out the level of ability of the students, the writer should find out the mean and standard deviation firstly. Mean is computed by adding a list scores and dividing by the number of the scores. Standard deviation is a measure of the spread of the score.

Mean and Standard Deviation of Experimental and Control Class.

$$\text{Mean } (\bar{x}) = \frac{\sum x_i}{n}$$

Note:

\bar{x} = the means
 $\sum x_i$ = the sum of pre-scores of both groups
 n = number of sample

The formula to get the Standard Deviation is:

$$S = \sqrt{\frac{n \sum x_i^2 - (\sum x_i)^2}{n(n-1)}}$$

Note:

S = standard deviation
 n = number of sample in X_1 of X_2
 $\sum x_i$ = the sun of the score X

From the table 1 it can be calculated that Mean and Standard Deviation of experimental class as follows:

$$n = 30$$

$$\sum x = 1252$$

a. Mean

$$\begin{aligned} (\bar{x}) &= \frac{\sum x_i}{n} \\ &= \frac{1252}{30} \\ &= 41,73 \end{aligned}$$

Based on the calculating above, the writer got the mean of experimental group was 41,73. Then the writer calculated the mean of control group with the same formula.

b. Standard Deviation

$$\begin{aligned} S &= \sqrt{\frac{n \sum x_i^2 - (\sum x_i)^2}{n(n-1)}} \\ &= \sqrt{\frac{30.57872 - (1252)^2}{30(30-1)}} \\ &= \sqrt{\frac{1736160 - 1567504}{(30)(29)}} \\ &= \sqrt{\frac{168656}{870}} \\ &= \sqrt{193,85} \\ &= 13,92 \end{aligned}$$

Based on the calculating above, the writer got the standard deviation of experimental group was 13,92. Then the writer calculated the standard deviation of control group with the same formula.

Table 5

The criteria level of student's ability in experimental class

	The Criteria
High	$(\bar{x}) + S$ $41,73 + 13,92 =$ $55,65$
Medium	$(\bar{x}) - S$ $\leftrightarrow (\bar{x}) + S$ $41,73 - 13,92 \leftrightarrow$ $41,73 +$ $13,92$ $27,81 \leftrightarrow 55,65$
Low	$\bar{x} - S$ $41,73 - 13,92$ $27,81$

Mean $\bar{x} = 41,73$
 Standard Deviation (S) = 13,92

To find out the percentage of criteria level ability of the students, the formula is:

$$P = \frac{f}{N} \times 100\%$$

Note: P = percentage
 f = frequency number of the students
 N = total number of sample

Table 6
 The level of students' ability in experiment class.

Level Ability	The Criteria	Frequency number of the students	Perc
Highest	More than 55,65	28	93%
Medium	Between 27,81-55,65	2	06%
Lowest	Less than 27,81	-	-
Total	30	100%	

From the data above it can be seen that the ability of the students is in highest level in the which the students who get more than 55,65 are 28 students. The students who are at medium level with score between 27,81-55,65 are 2 students and none of them in lowest level.

Mean and Standard Deviation of Control Class

From the table 2 it can be seen that Mean and Standard Deviation of control class by the number of subject is 30 (n = 30) and total value of pre-test is 900 (X = 900) as follows; (a) mean is 30 and standard deviation is 11,34

Table 7
 The criteria level of student's ability in control class

Level Ability	The Criteria
High	$(\bar{x}) + S$ $30 + 11,34 = 41,34$
Medium	$(\bar{x}) - S$ $\leftrightarrow (\bar{x}) + S$ $30 - 11,34 \leftrightarrow 30 + 11,34$ $18,66 \leftrightarrow 41,34$

Low	$(\bar{x}) - S$ $30 - 11,34$ $18,66$
-----	--------------------------------------------

Mean $(\bar{x}) = 30$
 Standard Deviation (S) = 11,34

Table 8
 The level of students' ability in control group

Level	The Criteria	Frequency number of the students	Percentage
Highest	More than 41,34	25	83%
Medium	Between 18,66-41,34	5	16%
Lowest	Less than 18,66	-	-
Total	30	100%	

From the data above it can be seen that the highest students' ability who get more than 41,34 are 25 students. The students who are at medium level with score between 18,66-41,34 are 5 students and none of them in lowest level.

CONCLUSION

After analyzing the data to find out the effect of TPS in reading comprehension, the researcher get conclusion as follows:

1. The learners felt more enjoyable and interested in learning reading comprehension by using Think-Pair-Share strategy. It is showed by their enthusiasm while the researcher applies this technique for them.
2. Think-Pare-Share strategy is suitable to apply in teaching reading because it can improve the students' achievement in reading comprehension.
3. Teaching reading comprehension by using Think-Pair-Share strategy is significantly effects than by using Conventional Method. It is proven based on the mean of experiment group is higher than the mean of control group. The mean of students' score in

experiment class is 41,73 than in control class is 11, 34. There are 28 students who get the highest score in experiment class. They get the mean score more than 55. 65 or 93% students get high score while in control class there are 25 students who get the 41, 34 mean score or 83% as the highest score.

from the data above it can be seen that the ability of the students in the control class is lower than the students in the experiment class. This is because the students in the experiment class are given a learning model that is more innovative and interesting than the control class. The results of the research are as follows:

Table 1
 The result of student ability in the control class
